

Notes:

- not sure how we divide this into PCB's. Depends on where the switches are located, and whether or not we can put everything shown except for the processor board onto a single board.
- the connector choices and locations depend on how many PCB's we have
- if we use the Huzzah to get 3.3 volts, we save a voltage reg & some board space, but need a 3.3 path to servo power board
- merge regulation and servo boards? Merge processor and servo boards?
